

Things I want

- UPS for Basement 1200W ?? should be enough to hold servers up for at least 15 mins
- 10th gen intel for Unraid server. Should reduce power at least \$200 per year if running constantly
 - Dell Optiplex 7090?? looks to have most of the features I would like
- PF Sense Firewall. Maybe use a Dell 3040 that I already have and buy additional network cards for it?? I would also have to buy a access point. Ubiquity seems the best ? but I can probably turn my old router into just an access point.
